Introduction:

Title of the project: Daily Task system.

Research Question:

How can basic HTML, CSS, and JavaScript help users organize their daily tasks with a simple and fast system?

Objective of the project:

The project aims to design a system that can help the user write and organize their daily tasks, allowing adding, removing, and viewing notes about those tasks.

Expected outcome:

The system will allow users to log in, then add, show, and delete their tasks in a sequential list.

Methodology:

The system will start with a login page that takes a name and password as input.

The system will check the name and password; if true, it will direct the user to the task management page, else it will show a message that the name or the password is not correct.

- In the task management page, the user is allowed to add tasks; those will be shown in a list.
- The user will be allowed to remove any task with a delete button that is placed next to each task.

Flow chart:

show login page():

name = input user name

password = input password

if name and password = true:

show add task

hide login page

else:

show "not true"

add task():

while login:

list tasks = []

show list tasks

task = input task

tasks.append(task)

delete task = tasks.delete(task)
